## I. Application

This document defines the communications method for control of the NEC LCD monitor, MultiSync P404 /P484 /P554 /V404 /V484 /V554/ V404-T/ V484-T/ V554-T/ P654Q/ P754Q/ V554Q/ V654Q/ V754Q/ V864Q/ V984Q/ C651Q/ C751Q/ C861Q/ C981Q/ UN462A/ UN462VA/ UN492S/ UN492VS/ UN552/ UN552V/ UN552S/ UN552VS/ UX552/ UX552S when using an external controller.

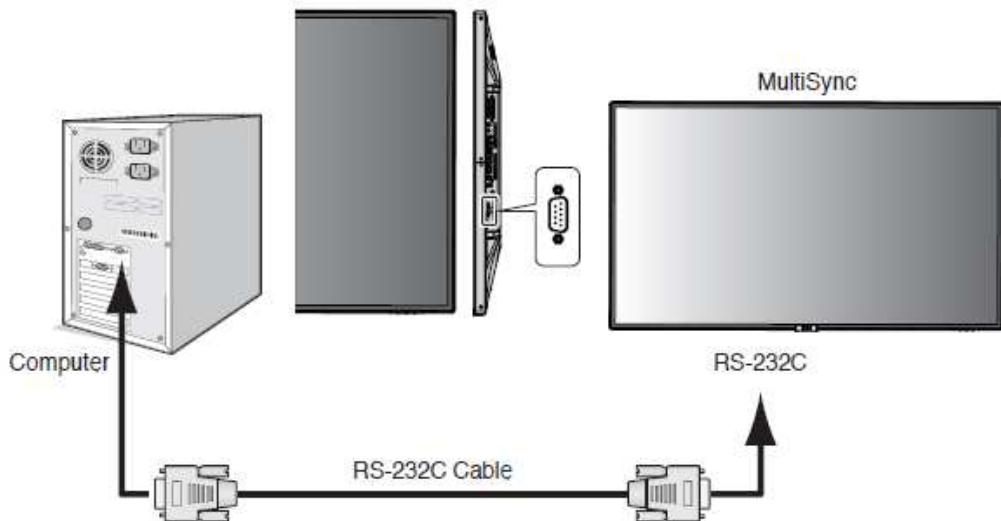

## II. Preparation

### 2. Connectors and wiring

#### 2.1 RS-232C Remote control

Connector: 9-pin D-Sub

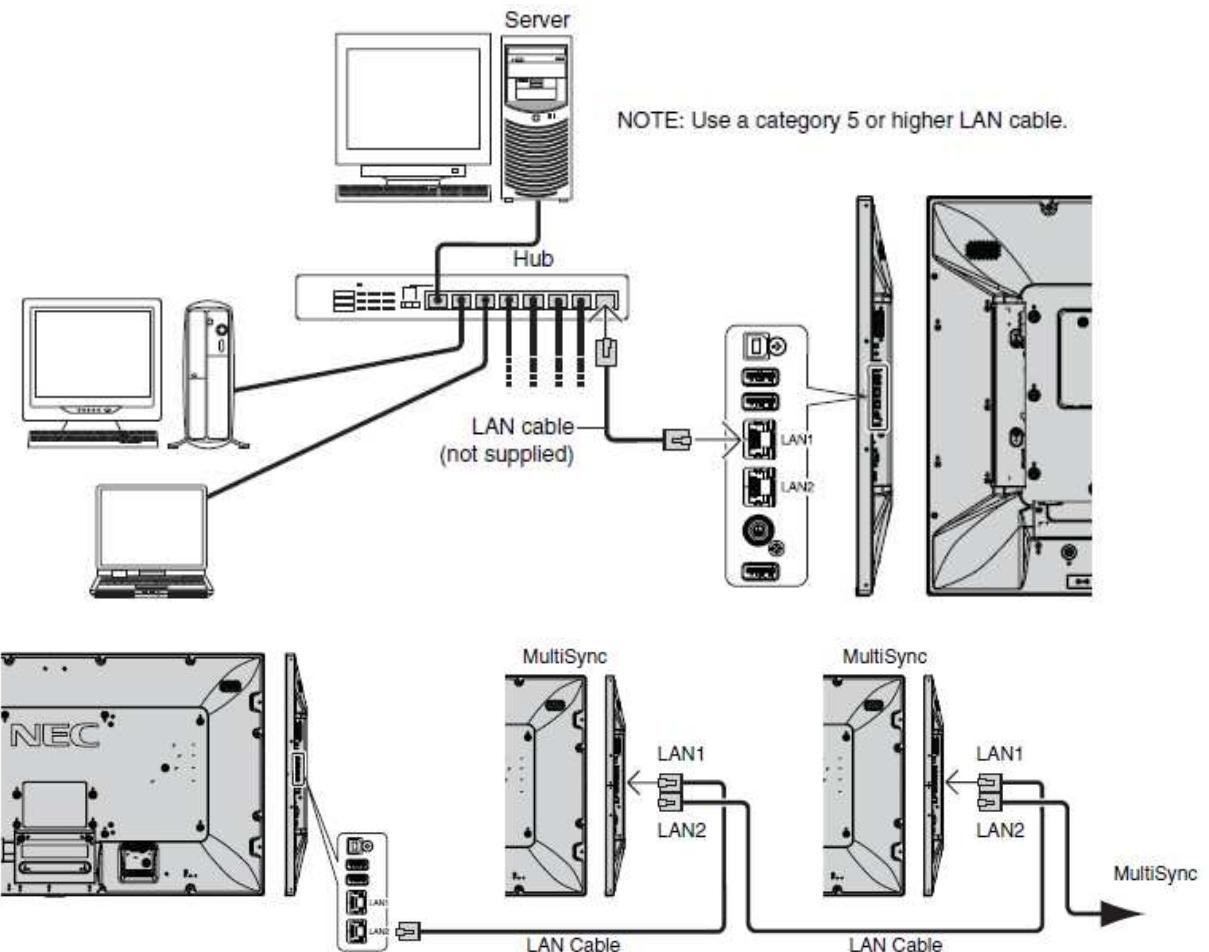

Cable: Cross (reversed) cable or null modem cable

(Please refer "Controlling the LCD monitor via RS-232C Remote control" on User's manual.)

## 2.2 LAN control

Connector: RJ-45 10/100 BASE-T  
Cable: Category 5 or higher LAN cable

(Please refer "Controlling the LCD monitor via LAN control" on User's manual.)

### III. Communication specification

#### 3. Communication Parameter

##### 3.1 RS-232C Remote control

(1) Communication system	Asynchronous
(2) Interface	RS-232C
(3) Baud rate	9600bps
(4) Data length	8bits
(5) Parity	None
(6) Stop bit	1 bit
(7) Communication code	ASCII

(Note)

A byte interval of the command should be within the 100ms.

##### 3.2 LAN control

(1) Communication system	TCP/IP (Internet protocol suite)
(2) Interface	Ethernet (CSMA/CD)
(3) Communication layer	Transport layer (TCP) * Using the payload of TCP segment.
(4) IP address	(Default) Automatic setup * If you need to change, Please refer "Network settings" on User's manual.
(5) Port No.	7142 (Fixed)

(Note)

The monitor will disconnect the connection if no packet data is received for 15 minutes.  
And the controller (PC) has to re-connect to control the monitor again, after 15 minutes or more.

##### 3.3 Communication timing

The controller should wait for a reply packet before the next command is sent.

(Note)

When the following commands are sent, a controller should wait for specified period after receiving the reply command before sending the next command.

- Power On, Power Off: 15 seconds
- Input, PIP Input, Auto Setup, Factory Reset: 10 seconds

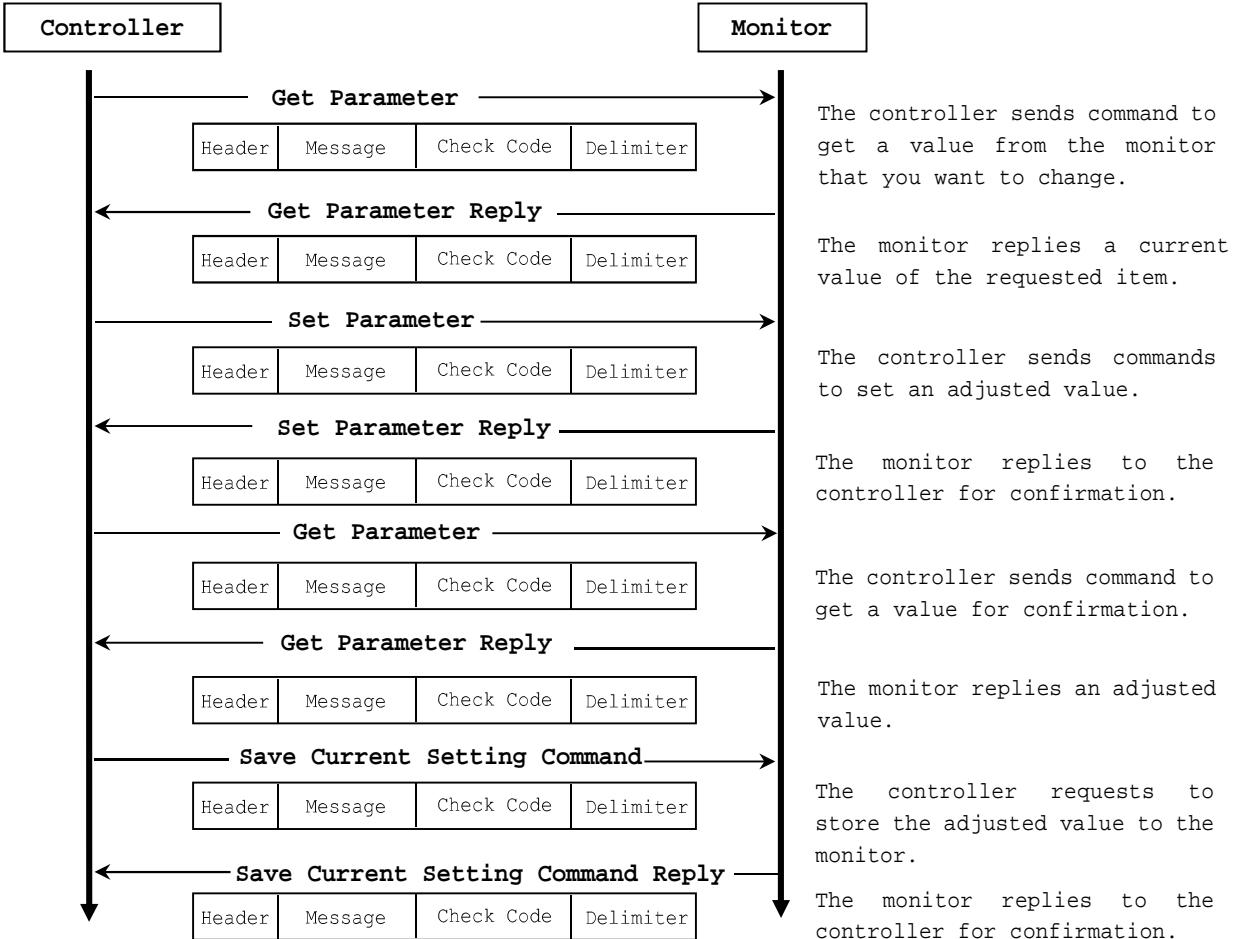

## 4. Communication Format

Header	Message	Check Code	Delimiter
--------	---------	------------	-----------

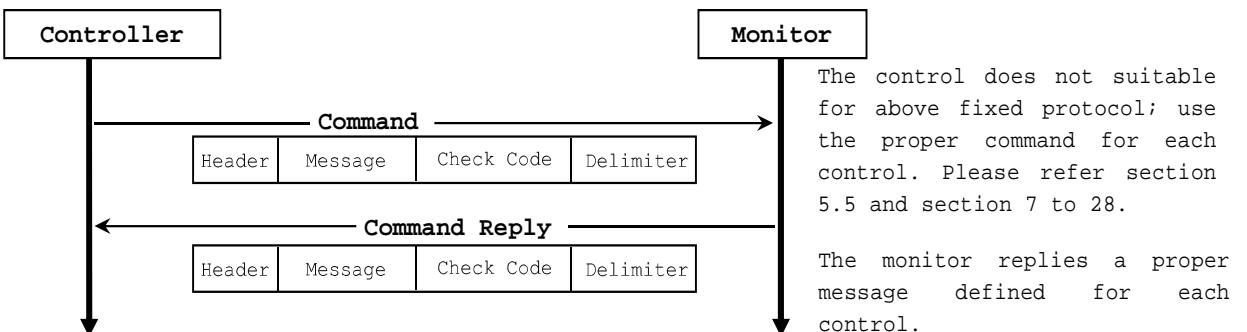

The command packet consists of four parts, Header, Message, Check code and Delimiter.  
Note: Don't add extra data (Example: padding data) after Delimiter.

Recommended sequence of a typical procedure to control a monitor is as follows,  
[A controller and a monitor, two-way communication composition figure]

- For the general command (see the part "6.3. Operation Code (OP code) Table")

The NULL message returned from the monitor is used in the following cases;

- To tell the controller that the monitor does not have any answer to give to the host (not ready or not expected)
- A null message will be returned by the monitor if the "Start Proof of Play" command is sent and the monitor has already started Proof of Play.
- A null message will be returned by the monitor if the "Stop Proof of Play" command is sent and the monitor has not started Proof of Play.
- Complete "NULL Message" command packet as follows;

## 15. Security Lock

### 15.1 Security Lock Control

This command sets the condition of security lock function to "LOCK" or "UNLOCK".

If security pass codes 1st to 4th are matched with monitor resisted pass codes, then this command is executed, and reply no error status and a new condition.

If codes aren't matched with them then setting isn't changed, and reply error status and a current condition.

If the monitor receives this command while waiting for Pass codes inputs, then it only checks Pass cords (and releases image muting if Pass codes are OK) and doesn't apply "EN" parameter.

- The password data is encoded as the following procedure.

Ex.) In the case of password data "1234"

Step1: Password data is handled as character code.

Example:

"1234" -> 31h 32h 33h 34h (ASCII)

Step2: The hexadecimal value of each original character is encoded as two ASCII characters representing the hex value.

Example:

31h 32h 33h 34h -> '3'-'1'-'3'-'2'-'3'-'3'-'4'

Step3: Password data is handled as character code once again.

Example:

'3'-'1'-'3'-'2'-'3'-'3'-'4' -> 33h 31h 33h 32h 33h 33h 34h  
(ASCII)

Step4: The hexadecimal value of each original character is encoded as two ASCII characters representing the value.

Example:
